

LOCAL GREEN DEALS

A Blueprint for Action

The European Commission's
100 Intelligent Cities
Challenge

An initiative by **EISMEA** and **DG GROW**

LEGAL NOTICE

This Blueprint has been produced as part of the Intelligent Cities Challenge, a European Commission initiative. The information and views set out in this report are those of the author(s) and do not necessarily reflect the official opinion of EISMEA or of the European Commission. Neither EISMEA, nor the Commission can guarantee the accuracy of the data included in this report. Neither EISMEA, nor the Commission or any person acting on their behalf may be held responsible for the use which may be made of the information contained therein.

The content of the Blueprint is subject to the evolution of EU law and policy context, including any changes to the European Green Deal and associated funding opportunities. It represents the state of play as of December 2022.

This Blueprint has been compiled under the Service Contract No EASME/2019/OP/0016 between the European Commission and Technopolis Group, as extended by the Service Contract subcontract EASME/201 between Technopolis Group and ICLEI – Local Governments for Sustainability. This service contract relates to the development and implementation of the Intelligent Cities Challenge.

More information on the European Union is available on the Internet (<http://europa.eu>).

About the Intelligent Cities Challenge

The Intelligent Cities Challenge (ICC) is a European Commission initiative that supports cities in using cutting-edge technologies to lead the intelligent, green and socially responsible recovery. ICC cities and their local ecosystems will be engines for the recovery of their local economies, create new jobs and strengthen citizen participation and wellbeing. The first phase of ICC supported a total of 136 cities in the period from 27 January 2020 to 30 November 2022. The ICC is continued by the second phase - launched on 1 December 2022 - with a new group of cities to be selected to take part in the network and benefit from advisory support.

Cities receive one-to-one strategic advice from international experts and mentor cities. In the first phase of ICC this was delivered across five themes: green economy and local green deals; improving citizen participation and the digitalisation of public

administration; green and digital transition in tourism; resilience of local supply chains; and up- and reskilling of the workforce. The second phase's thematic focus concentrates on the green and digital transition as well as the proximity economy. Cities are also supported by transversal services covering access to data, access to finance and to technology through Tech4Good, a marketplace of innovative solutions.

The ICC is part of a wider EU support system that recognises the importance of delivering on the promises made by the European Green Deal, the digital strategy and other EU policies. It looks to help cities deliver on the transition, moving towards an increasingly green, digital, service-oriented and low-carbon economy, supported by a knowledge-based society, that enables circular economy systems through 'local value loops', evidence-based reskilling and sustainable investments.

More information on the ICC is available at www.intelligentcitieschallenge.eu

Seeing Local Green Deals in context: a summary

A Local Green Deal is a local tailor-made action plan to accelerate and scale-up a city's green transition. It builds on and joins up existing strategies – e.g. sustainable energy and climate action plans, circular economy plans, resilience or economic development plans – legislation, market and financial incentives into a coherent approach to advance the EU Green Deal locally. Local Green Deals can only work if they empower local businesses and civil society to lead the way. Local Green Deals or LGDs address the fact that standard governance and policy implementation will not be sufficient to achieve the transformation required to truly implement sustainable development. Implementing the European Green Deal at the local level requires integrated, multidisciplinary governance, regulations, approaches and instruments to support the policy areas outlined in the European Green Deal to deliver joint action.

Local Green Deals aim to put sustainable development at the core of all local government decision-making rather than a single strategy from one department. Local Green Deals should draw on approaches of the past 10 to 15 years but address key areas that have been missing from traditional approaches or seen as too complex to implement.

The ICC work has developed Local Green Deals as:

- An integrated, cross-disciplinary approach to city governance. A multi-level vertical governance process (which engages the local, regional, national and international levels) ensuring that cities contribute to the development of relevant legislation, initiatives and in particular financing programmes that have a direct impact on the ground.
- A key obstacle to the transition is not a lack of knowledge or technologies, it is the lack of joined up policies and the capacity to implement them. Legislation developed at a national level tends to address single issues and does not take into account other

related issues which it can have an impact on. Implementation at the local level is usually done in a siloed manner.

- This silo-based form of governance, designed for traditional city operations, cannot drive the scale of transition required. An integrated horizontal approach between different departments and stakeholders across the city is needed. For example, embedding cross-cutting systemic solutions such as climate change mitigation and adaptation, the circular economy and social inclusion.
- Multi-stakeholder partnerships and a credible commitment to long-term change, captured in written agreements and with continuous collaboration between local business and other local stakeholders.
- Most importantly, having an action-oriented approach through collaboration, co-production, co-design and co-innovation approaches will support the transition. A deal which provides a joint mechanism of delivery through better regulation (if needed), financing, innovation and the involvement of a number of organisations will help to support several policy objectives. This can be through a simple citizen-led project in a district of a city, contributing to systemic innovations and digital transformations in transport, energy, construction and circular development.

It is important to note that LGDs are NOT:

- A new strategy or targets.
- A series of isolated sustainability policies or initiatives.
- A top-down approach that only the city takes responsibility for, or a rebranding exercise.

Liaison between Climate City Contracts and Local Green Deals

The approach of the Climate City Contracts (CCCs) as part of the 100 Climate Neutral and Smart Cities Mission and the Local Green Deals (LGDs) are very similar. They are both working towards the European Green Deal's goals and they are both supported by the European Commission, either via the Intelligent Cities Challenge (for LGDs) or via the NetZeroCities project (for CCCs). CCCs are a form of Local Green Deals. The key difference is that CCCs are based on a mission with a timeline until 2030 and focus on CO₂ emissions reduction, while LGDs have a broader focus on the green transition and embrace, in addition to decarbonisation, issues such as circular economy actions, raw materials shortages, sustainable products and services and sustainable food systems. In that regard, CCCs and LGDs complement each other and are great means to integrate sustainability actions.

1 Introduction

The world is facing major environmental, economic and social challenges that require a substantial transformation across all aspects of society. By now, the awareness and sense of urgency for action on climate change, biodiversity loss and global resource depletion seems widespread. However, implementation of fast and radical transformation is slowed down due to economic and social reasons. Unless systemic changes are made to the economy and social inequalities are addressed, we will not be able to solve the climate and ecosystem crisis.

COVID-19 and the subsequent economic crisis, as well as the energy crisis, inflation and food price increase as a consequence of the war in Ukraine, have made the situation even more challenging. However, they also provide an opportunity to accelerate change. The pandemic has highlighted that the road to recovery requires rethinking the way we do things, to ensure a more resilient future. Picking up from where we left off and doing things how they have always been done might provide a short-term fix, but it will not provide long-term solutions for systemic challenges. Given the shortage in fossil energy supply due to the conflict in Ukraine, this would mean to increase efforts to decarbonise Europe's energy systems.

This guide has been developed as part of the European Commission's *Intelligent Cities Challenge* (ICC)¹. It provides cities with a blueprint to develop Local Green Deals (LGDs), with good practice case studies, to support them with the implementation of the *European Green Deal* (EGD) at the local level.

Based on a survey conducted with the ICC cities in 2022, cities already take many actions in line with the LGD approach and see benefits of implementing this approach

¹ The Intelligent Cities Challenge is a European Commission initiative that supports 136 cities in using cutting-edge technologies to lead the intelligent, green and socially responsible recovery,

in their local contexts. At the same time, they face significant challenges when it comes to stakeholder engagement, financing and governance and would be happy to receive more support to continue their work with the LGD approach. This guide is a first step for all cities that want to start their LGDs journey.

This guide outlines the rationale behind LGDs, its key principles, levers and the steps for cities, stakeholders and local communities to take to implement a LGD. Cities looking for practical steps and illustrations of a LGD approach will find case studies in the annex.

While this Blueprint is the first of its kind, it relates to and supports other European initiatives relevant to cities and the European Green Deal objectives: the [Committee of the Regions' Green Deal Going Local Campaign](#) and the [Mannheim Message](#). The Committee of the Regions has also published its own handbook on Local Green Deals entitled *Giving local and regional authorities guidance for the green transition*. In 2022, the EU launched its *100 Climate-Neutral and Smart Cities by 2030 Mission*. The mission aims to bring 100 European cities to climate-neutrality by 2030 and to ensure that these cities act as experimentation and innovation hubs to enable all European cities to follow suit by 2050. Since the publication of the first version of this blueprint, a number of EU-funded Local Green Deal projects have been launched, including [ALLIANCE](#) and [CLIMAA](#), as well as philanthropically funded projects such as [Fair Local Green Deals](#).

It also builds on a number of national initiatives and regulatory developments, such as the national energy and climate plans (NECPs)² adopted by all EU Member States in 2019.

² To meet the EU's energy and climate targets for 2030, EU countries need to establish a 10-year integrated national energy and climate plan (NECP) for the period from 2021 to 2030. The rules required the final NECP to be submitted to the Commission by the end of 2019.

The European Green Deal

The European Green Deal (EGD) aims to make the EU's economy sustainable by turning climate and environmental challenges into opportunities and making the transition just and inclusive for all. With the EGD, the European Union committed to *"no net emissions of greenhouse gases in 2050, economic growth that is decoupled from resource use and no person and no place is left behind"*. It is the first continent with a clear ambition and a comprehensive plan for climate neutrality.

Reflecting those policy areas, a number of initiatives are emerging at the EU level to support the implementation of the EGD. These include, for example, the [European Climate Pact](#), the [Circular Economy Action Plan](#), the [New Bauhaus Movement](#), the [Renovation Wave](#) initiative, the [European Skills Agenda](#), [REPowerEU](#), [Ecodesign for sustainable products](#) among others. To support cities with this ambitious transition, the EU has launched the 100 Climate Neutral and Smart Cities Mission, the Intelligent Cities Challenge, the Covenant of Mayors, the Smart Cities Marketplace, Living in EU, among others.

Standard policy implementation will not suffice to achieve the transformative actions required to truly implement sustainable development. Instead, the policy areas of

the EGD need to reframe and ensure that sustainability actions are implemented in a more integrated way. Adapting the EGD to the local level requires linking up and integrating the policy areas illustrated below and, in turn, delivering consolidated implementation and action.

Why Should Cities Develop a Local Green Deal?

3.1 Why cities and what is their role?

Ultimately, all of the EGD policies are implemented in cities. Therefore, they have a crucial role to play in its delivery, through facilitating integrated action and bringing local stakeholders on board in the transformation process.

The European Union consists of more than 80,000 cities and towns (shortened as “cities” across the rest of the document), that are mandated to promote the long-term wellbeing of their citizens. They implement 70% of EU legislation, handle one-third

The European Union
consists of more than
80,000
cities and towns

They implement
70%
of EU legislation

of public spending and manage two-thirds of public investment. In addition, they are often responsible for the direct provision of many public services.

Cities are centres of economic activity, knowledge generation, community engagement, cradles of innovation and of socio-economic transformation. They bring together local businesses, entrepreneurs, social enterprises, educational establishments and citizens. Together, they can find solutions to tackle the biggest challenges of the twenty-first century, whether it is delivering on climate ambitions, reducing fossil energy use, or building sustainable recovery and resilience post-COVID and crisis resulting from the war in Ukraine.

Cities and their industrial ecosystems³ will be the engines of recovery, stimulating the development of new markets for climate neutral and circular products, the decarbonisation and modernisation of energy-intensive industries, creating new jobs and reskilling workforces. In particular, the proximity and social economy ecosystem is key to deliver a people-centric industrial policy and achieve a resource efficient, resilient, low-carbon and socially responsible society.

Cities manage a number of key sectors in urban areas, such as mobility, construction and waste management. They are ultimately responsible for controlling land use and urban planning. Their public procurement and investment budgets play a key role in driving demand for sustainable products and services, which impacts decisions on infrastructure for energy, transport and water.

For all of these reasons, cities are called on to lead the transition and deliver the EGD through concrete actions at the local level. In order to coordinate these actions, they must develop more comprehensive governance structures and networks. This will allow the transition of their entire economy.

³ The European Commission has identified 14 industrial ecosystems, each of which comprises all the economic actors working along the same supply-chain (e.g. health, social and proximity economy etc.). Using this categorisation can help cities better map out the stakeholders which can support their LGD. More information on the concept and each industrial ecosystem is available [here](#).

3.2 The work has already begun and the time is right

Over the past decades, most European cities have developed strategies to address the environmental, social and economic challenges associated with rapid urban expansion and unprecedented growth in human activity. For example, between 2014–2020, more than 680 cities implemented sustainable development strategies under the cohesion policy that focuses on climate adaptation, air quality, low carbon society, mobility, circular economy, energy or nature-based solutions⁴. In most cases, sustainability strategies support the key policy areas of the EGD. However, many of the strategies have been shaped and sometimes constrained by pre-existing administrative structures, decision-making processes, budgetary constraints and changing political agendas. Instead of looking at sustainable development holistically (that is, as a core part of a city and embedding it across all areas), many strategies have often been designed to target specific issues, sectors, or processes.

This trend has been mirrored by several European initiatives developed to date to support sustainability at the local level, such as the *Covenant of Mayors*, the *EU Mission on Climate-neutral and Smart Cities*, the *Green City Accord*, the *Circular Cities Declaration*, the *Circular Cities and Regions Initiative*, the *European Green Capital Award and Network*, *Network Nature*, the *Climate Pact and the Smart Cities & Communities framework*⁵ among others. While these initiatives are key to promoting valuable ways for cities to become engaged in the transformation towards a sustainable Europe, their approach focuses on specific sectors and priorities that are complementary.

⁴ Article 7 cities' of the European Regional Development Fund.

⁵ The Smart Cities & Communities framework, established in 2012 by the European Innovation Partnership, embraces the holistic and integrated approach which LGDs support e.g. its Smart Cities Marketplace looks across sectors at the 18 integrated H2020 Lighthouse Projects, translating them into financing for city projects

Working on sector, or topic-specific initiatives and strategies that have been developed in isolation can lead to conflicting agendas, implementation challenges⁶ and competition for resources. In the current context of cross-cutting challenges, such as the climate emergency, socio-economic crisis and budgetary restrictions, cities need to purposefully align their different policies to ensure a coherent approach.

A combination of supporting international frameworks (e.g. the Paris Agreement, the 2030 Agenda for Sustainable Development and its 17 Sustainable Development Goals (SDGs)), progressive European and national sustainability policies and initiatives and an urgency for cities to deliver on sustainability rather than strategise, makes now the right time to develop approaches that support implementation and deliver action – Local Green Deals. There is also a unique opportunity for cities to benefit from the favourable European and national financing initiatives, such as the European Union's unprecedented *NextGeneration EU* recovery plan, national recovery plans and the EU structural funds for 2021–27, which will take the European Green Deal's priorities into account.

Finally, private stakeholders have never before been so engaged on questions of sustainability: Figure 1 for example, shows how businesses are starting to adapt to meet rising market demand for sustainable products. This creates an unprecedented opportunity for cities to collaborate with local stakeholders around sustainable initiatives.

⁶ For example, the responsibility for delivering better air quality targets might lie within a city's environment department and not be connected to a city's transport, industry or construction department

Figure 1: The growing market for sustainability

Changing stakeholder expectations

Talent

84%

of employees are more loyal to a company that contributes to social / environmental issues

B2C customers

+30%

of consumers are looking to move towards sustainable companies and products after COVID-19

B2B customers

+81%

of companies stated that their commitment to sustainability has increased since 2017

Changing market environment

New / more sustainable products are displacing 'old'

~200%

annual growth rate of BeyondBurgers; alternative meat is growing 5-20x faster than beef in some EU countries

Capital is shifting to sustainability

>30%

of capital is compliant with environmental, social and governance-criteria (ESG); highest scoring ESG players enjoy ~1.1pp cheaper weighted average cost of capital (WACC); investors are becoming activists

Stringent targets are the new normal

23%

of Fortune 500 companies have a science-based target in 2020, compared to ~5% in 2015

What are Local Green Deals?

4.1 A new governance approach to accelerate the transformation towards sustainability

To deliver the EGD at the local level cities need:

Integrated goals

An assessment of strategies and policies to bring together targets, local plans, partnerships, funding and initiatives to ensure climate-neutrality and sustainability are implemented in a coherent way;

Governance

New collaborative governance and management structures that take into account multidisciplinary values (environmental, economic and social) to support integrated decision-making, policy development and action in a broad context;

Partnership

A multi-stakeholder approach, where public, private, community and voluntary sectors from across the city' work together to deliver common goals.

Action

An approach where partnerships deliver concrete action, leading to collaboration agreements;

Most European cities already have policies, projects and initiatives in place to support sustainable development and sustainable economic transformation. Bringing together and analysing existing strategies and plans is an important first step, for example, Sustainable Energy and Climate Action Plans (SECAPs), Sustainable Urban Mobility Plans (SUMPs), Sustainable Development Goals (SDG) Strategies, land-use plans and sustainability strategies. The goals of each strategy and plan need to be checked and aligned with the ambition of the EGD to ensure the ambitions achieve the necessary transformation at the local level. Identifying overlaps, synergies and gaps is also key to the analysis. Bringing together plans and actions and building a network of local partners to support delivery will improve efficiency in the use of existing resources and will accelerate implementation.

A LOCAL GREEN DEAL SHOULD

Ensure the multilevel governance of strategies, budgets and initiatives, through agreements between local governments and regional, national and EU level institutions (vertical) and between actors working at the local level (horizontal)

Align strategies and bring together targets, partnerships, funding and initiatives across city departments

Provide an approach for addressing cross-cutting issues such as the economic future of an area, reskilling, social exclusion and climate change

Provide a shared vision and sense of long-term priorities for the city and reflect those in the urban planning framework

Promote cultural change and empower all people to participate and become involved in decision-making and co-creating solutions

Provide effective governance and structures to encourage rapid action, manage collaborations, improve cost- efficiency and make the most of available resources

Help embed sustainability into the city's budget and investment plan

A LOCAL GREEN DEAL IS NOT

A top-down approach where the city takes sole responsibility for delivering policies and initiatives

A new sustainability strategy or a set of environmental targets

A series of isolated sustainability policies or initiatives

A rebranding exercise for the city's existing practices

A certification or award scheme

A standardised approach to sustainability policy

A funding guide

ADDED VALUE OF A LOCAL GREEN DEAL APPROACH

A multilevel governance approach is key to accelerating the implementation of sustainability goals and ensuring action plans are resilient to political and administrative changes.

A comprehensive overview of the city's sustainability goals and actions will help avoid silos, identify existing implementation gaps and create new opportunities for cooperation around existing goals.

Ensuring sustainability goals are addressed through the city's entire policy, strategic and governance framework will minimise the risk of conflicts between different goals and reduce competition for resources between departments.

A credible commitment to long-term change is essential to secure the trust and collaboration of local stakeholders with cities.

Nurturing a local culture of sustainability will ensure the long-term commitment of stakeholders to support the delivery of sustainability.

Flexible, joined-up governance and management structures will decrease administrative costs, support innovation and encourage local stakeholders to work with the city.

A comprehensive approach to sustainability may help identify new funding sources or decrease funding costs for city investment priorities

4.2 Key Principles of Local Green Deals

‘Deals’ are not new strategies or policies but a new governance approach to accelerate action towards sustainability and climate neutrality. While cities face common challenges, their priorities and the context in which they operate may differ. LGDs will need to reflect diverse local policies and priorities, including the culture, heritage, employment base and how engaged citizens already are in the city. As each city has unique characteristics, deals developed by cities may take different shapes. This is also a reiterative process, where cities build and improve as they work towards their targets.

However, all LGDs should share key common principles, aiming to build upon existing best practice models of integrated sustainability strategy (e.g. Sustainable Energy and Climate Action Plans (SECAPs), resilience plans, sustainable economic development plans, or circular economy action plans) and turn them into action. Those principles distinguish LGDs from traditional approaches to sustainability and should help cities achieve their goals more effectively than in the past. Buying into those principles will require cities to make the most of all the levers available to them to promote, facilitate and enable change.

LGD Principle 1:

BUILD ON WHAT IS ALREADY THERE

Most European cities already have policies, strategies and initiatives in place to support sustainable development. The purpose of LGDs is to bring these together in a coherent way, so as to leverage their impact more effectively.

Levers:

- Mapping of existing local policy framework, budget and timelines
- Governance structures allowing for a strategic alignment of the existing local policy framework, budget and timelines.

LGD Principle 2:

THINK BIG

Set out a shared, long-term, strategic vision and provide an approach for considering and deciding how to address cross-cutting issues such as climate change, the circular economy and social exclusion.

Levers:

- Set strategic goals, lead decision-making and allocate budget for cross-cutting policy areas
- Cooperation between the city and other public authorities that have strong strategic, decision-making and budgetary remit in the area (e.g. public utilities company, local transport authority)

LGD Principle 3:

LEAD BY EXAMPLE AND SHOW COMMITMENT

Political leadership shows commitment and gives credibility when developing and implementing LGDs with citizens, stakeholders, businesses and potential funders. Leaders have to be willing to change what they do and how they develop LGDs. They will need to create an enabling environment for change, communicate the importance of the change they are advocating for and remain actively involved. Leadership will also need to acknowledge, identify and manage risks associated with developing LGDs and working in partnership.

Levers:

- Hands-on political approach, creating accountability for sustainability goals within the local government
- Strong local communication on LGDs

LGD Principle 4:

INTEGRATED AND COOPERATIVE PROCESSES

Multilevel governance between all levels of government (vertical integration), will be required to ensure cities input into the development of relevant legislation and initiatives (on topics such as transport, energy, the built environment and climate) and also to ensure that funding programmes respond to the needs of cities.

Levers:

- Inputs into the regional, national and European policy development process

LGD Principle 5:

INTEGRATED LOCAL GOVERNMENT

Addressing certain sustainability issues that have traditionally been addressed by sector, by a single organisation, specific department or strategy of a city will require a change of approach, structure and culture. Horizontal coordination in governance will be required, as many cross-cutting sustainability issues need to be addressed with, or require the cooperation of, different departments in a city. Horizontal coordination means working across silos. The traditional sustainability frameworks used by cities often rely heavily on a small number of departments – typically energy, transport and waste management – to reach sustainability goals. This can lead to competing strategies that are not aligned, as well as challenges when implementing actions. Successful LGDs require strong collaboration between different departments and stakeholders across the city. Departments with a cross-cutting remit that would not traditionally embrace sustainability as their goal should be particularly targeted (e.g. finance, procurement, economic and education departments). The key is to address competing priorities and identify synergies between policies and actions, while ensuring they address sustainability objectives in a long-term and coherent way.

Levers:

- Integrated management structures
- Incentivising staff to champion sustainability and collaborate across departments
- Training
- Using the city's urban development plan to coordinate cross-cutting sustainability objectives

LGD Principle 6:

COLLABORATE WITH STAKEHOLDERS

LGDs will require cooperation among local stakeholders. Cities have a privileged role to play as facilitator between public, private, voluntary, education, knowledge and community sectors, which can be used to convene and partner with others to support the development of LGDs, raise awareness and support implementation activities. LGDs can bring together local service providers from different sectors to provide cross-cutting solutions to meet local needs. Working collaboratively with stakeholders can improve efficiency and coordination and lead to more integrated, holistic and better solutions. Local stakeholders must act as ambassadors to amplify the reach of the city's sustainability initiatives.

Levers:

- Hands on political involvement in building relationships with key stakeholders
- Management structures incentivising staff to build relationships with local stakeholders
- Using staff as intermediaries to reach out to the community

LGD Principle 7:

‘DEALS’

LGDs need to ensure implementation and action with long-lasting impacts. There might be value in using city-led initiatives to kick start co-production, co-design and co-innovation approaches. Those actions will pave the way for long-term and systematic change in the way that the city works with stakeholders to implement their sustainability policies. Ultimately, LGDs should go beyond public-led initiatives. Once the city has established connections, trust and working practices with local stakeholders, there will be value in formalising their collaboration. A core element of LGDs is developing and implementing agreements (or “deals”) to cooperate. These agreements should clearly identify the key actions that each stakeholder commits to lead, the support offered by all of the signatories and timeframes for delivery. Such agreements should be reviewed and updated regularly, to maintain momentum when implementing the LGD.

Levers:

- Using publicly-owned assets (e.g. land or companies) to pilot collaborative projects
- Unlocking logistics, financial, regulatory and/or advisory support for local stakeholders driving forward sustainable initiatives
- Using written agreements to formalise long-term actions and partnerships

LGD Principle 8:

INNOVATIVE FINANCE

To achieve the goals of the European Green Deal, a significant investment programme will be required. Key to driving transformative actions will be ensuring that public funds are used to encourage private and civic sector actors to invest further into sustainable actions. Cities will need to use a mix of financial mechanisms to achieve this and stimulate the development of local social economy approaches and solutions, circular business models and local enterprises. A combination of direct economic incentives (e.g. in the form of grants and loans), fiscal measures (e.g. tax or subsidies) and co-investment structures (e.g. through public-private partnerships) will be required to ensure transformation.

Levers:

- Pooling existing budgets for sustainability initiatives
- Collaborating with the national government and the EU to secure funding packages
- Using publicly-owned assets (land or companies) to channel investment through partnerships
- Local regulation to promote sustainable investments
- Fiscal policy powers

LGD Principle 9:

SUSTAINABLE TECHNOLOGICAL SOLUTIONS

Technological innovations are re-shaping global societies and economies. In order to achieve a sustainable transition, cities must leverage those to their advantage. Their actions should be both adaptive (e.g. searching for, identifying and adopting technologies that can support their sustainability goals) and proactive (e.g. working with enterprises and research institutes to steer innovation towards solutions that will serve the interest of the citizens and the public good).

Levers:

- Using public procurement to pilot new technologies and create markets for sustainable solutions and encouraging other stakeholders to do the same
- Providing financial, logistical, or advisory support to local innovators

LGD Principle 10:

ENSURE RESILIENCE

The climate emergency, technological innovations, political changes and socioeconomic crisis are driving rapid transformation in the global economy and societies. Cities must ensure that they are resilient to those systemic challenges while trying to achieve their sustainability goals. Their governance processes, partnerships and action plans should focus on long-term commitments, adaptive management structures and robust risk mitigation strategies.

Levers:

- Setting long-term goals and commitments
- Creating independent multi-stakeholder governance structures
- Diversifying funding sources
- Building long-term partnerships and agreements to cooperate with local stakeholders
- Assessing and managing risks and identifying opportunities through regular monitoring

Local Green Deals and Financing

Cities are increasingly faced with limited human, financial and natural resources. LGDs can assist cities in developing, piloting and implementing various ways to finance their sustainable transition. Their ability to attract funding from a broad range of sources is essential to ensuring that LGDs can support a wide range of initiatives from cities and local stakeholders. Ensuring that those funding sources are combined effectively is key to ensuring that the cost-efficiency of individual actions is maximised.

5.1 Direct existing budgets towards sustainable initiatives

A LGD should be used as a framework to analyse and re-orient the way that cities spend their existing resources. By weaving in sustainability goals across their policy framework and daily management practices, LGDs should mainstream sustainability considerations into their budgetary decisions, both for capital investment, maintenance and operational expenditure. Wherever possible, existing local budgets should be directed towards initiatives, technologies, infrastructures and businesses that support the transformation towards a climate neutral, sustainable

city and society. Integrating innovation and sustainability considerations into public procurement processes will be one of the key tools that cities can use to achieve this.

When looking at opportunities to fund initiatives with positive environmental and social impacts, cities should ensure that the proposed activities align, as far as possible, with the *EU Taxonomy for Sustainable Activities*⁷. This will help ensure that the activities funded under a LGD are truly sustainable, improve the cities' ability to access European funding for those initiatives, improve access to private sector sources of green finance and help ensure that private stakeholders and investors understand the environmental standards that are expected from LGD-related activities.

5.2 Integrate budgets for better value for money

Cooperation across different policy sectors and areas of governance should encourage better cost-effectiveness in the funding of LGDs. Departments and public bodies from across the city should be actively encouraged to align their financial resources to deliver sustainable action jointly. Within legal limits, this should notably involve combining existing budgets to deliver better, more sustainable initiatives and looking for cooperation opportunities when applying for funding. Building up those integrated financial management practices should help increase the value-for-money of sustainable initiatives. A LGD should create a comprehensive framework to ensure that the different actions funded contribute to the achievement of the LGD objectives in a systematic and integrated way. The EU's *2021 review of green budgeting practices* in Member States can provide inspiration to cities looking to shape integrated budgets that support sustainable action.

⁷ The EU taxonomy for Sustainable Activities is a classification system establishing a list of environmentally sustainable economic activities. It is a key enabler to scale up sustainable investment and implement the EU Green Deal. By providing clear definitions to companies, investors and policymakers on which activities can be considered sustainable, it can help companies to plan the transition, protect investors from greenwashing and shift investments where they are most needed.

5.3 EU and national funds

In addition to providing a framework in the form of the European Green Deal, the EU and Member States have put in place financing mechanisms to support transformative recovery. These include the *Multiannual Financial Framework* (MFF) for 2021-27, the temporary *NextGenerationEU* (NGEU) recovery instrument (2021-24), the *Recovery and Resilience Facility*, the *2022 REPowerEU* and *Save Gas for a Safe Winter* and national recovery funds. There are opportunities for cities to tap into these funds – such as through innovation projects – in order to recover from the social and economic impacts of the pandemic, crisis resulting from the war in Ukraine and other geopolitical situations, while also securing green transition and resilience. In particular, 37% of the funding unlocked through MFF and NGEU is ring-fenced for initiatives supporting climate neutrality, while 20% is earmarked for initiatives supporting the sustainable digital transition.⁸

The strong political commitment to sustainability, demonstrated through a LGD, should help cities secure external funding opportunities. The vertical alignment of a LGD with national and European goals should provide a good starting point for cities to negotiate funding agreements with institutions and funding schemes, which support sustainable development initiatives. A LGD should improve cities' readiness to access relevant funding opportunities as they emerge.

A LGD could also envisage advisory support for the preparation of investments related to its activities. For example, advisory support is available from the EIB through *JASPERS* (Joint Assistance to Support Projects in European Regions) and *ELENA* (European Local Energy Assistance).

⁸ www.consilium.europa.eu/en/infographics/mff2021-2027-ngeu-final/

Examples of EU and national funds:

- ☆ New EU grant and loan opportunities linked to the EU Green Deal;
- ☆ Existing and new EU funding programmes for sustainability initiatives including *Horizon Europe*, *LIFE*, the *Single Market Programme* (replacing COSME), *Digital Europe*, the *ERDF*, the *Cohesion Fund*, *REACT EU*, the *ESF* and the *European Urban Initiative* (replacing Urban Innovative Action);
- ☆ Funding from the *European Investment Bank* (EIB), for example through thematic urban framework loans (which can be used to finance multi-sectoral investments targeting Green Deal priorities across a city's investment programme), or through urban financial instruments;⁹
- ☆ Sustainable infrastructure development programmes from the European Bank for Reconstruction & Development's *Green Cities programme*.

As highlighted by the pioneering work of several cities working on LGDs, it is acknowledged that the preparation phase of a LGD requires investing time and effort (see also the overview of key steps in *section 6* below). It has also been recognised that a neutral intermediary party is often useful in establishing effective public-private cooperation. Cities and intermediary organisations/administrations should advocate for EU and national funding opportunities to cover this preparatory phase, which is critical to the whole LGD process. Potentially, some of the advisory sources indicated above could support cities with such preparatory activities.

⁹ See Milan case study in the annex for an example of an EIB-funded LGD initiative

5.4 Private funds for public initiatives

Cities should also explore alternative ways to raise funding for public-led sustainability initiatives. Measures to be explored include raising taxes (e.g. land development taxes, increased taxes on unsustainable businesses, use of revolving funds) and setting-up new channels for local stakeholders to support publicly-led initiatives (e.g. green bonds and crowdfunding opportunities).

5.5 Leverage private investments

Cities should encourage private stakeholders to adopt a sustainability mindset in everything they do. Cities implementing LGDs should therefore develop an array of mechanisms to encourage private investment in sustainability initiatives.¹⁰

As a platform acting across sectors, the *Smart Cities Marketplace* (SCM) and its integrated Explore-Shape-Deal *Matchmaking process* can facilitate cities' access to private investment via its steadily growing investor network¹¹. Activities, such as dedicated SCM financing master classes, may also be organised by the SCM to provide cities with hands on advice to shape bankable LGD actions, which can be financed by private investment.

In addition, the *EU Climate Pact* will help share knowledge about measures encouraging private investment in sustainable initiatives and provides helpful resources to cities and local stakeholders on that topic.

¹⁰ NB: As national regulatory frameworks will impact what can legally be done, cooperation with national governments will be essential in determining what measures can be developed in a city or region

¹¹ <https://smart-cities-marketplace.ec.europa.eu/matchmaking/investor-network>

Potential ways to finance LGDs:

- ☆ Fiscal incentives for sustainable initiatives, such as tax breaks;
- ☆ Policies promoting sustainable investment, such as urban planning policies requiring private development projects to meet certain environmental and social standards;
- ☆ Gap or low-cost funding for initiatives demonstrating string alignment with local sustainability goals, such as grants or low-interest loan;
- ☆ Financial partnerships for viable projects demonstrating strong alignment with local sustainability goals. For example, loan securitisation, or equity investment in private initiatives;
- ☆ Partnership structures leveraging public assets to support private initiatives, such as providing land, buildings, or free advisory support for private stakeholders to develop sustainable initiatives;
- ☆ Setting-up complementary currencies to support sustainable local initiatives.

Key Steps to Develop a Local Green Deal

6.1 Overview

Implementing a LGD does not require a separate or dedicated strategy and can be started with some simple steps. Having a well-developed approach in place will help to ensure that sustainability is effectively and systematically integrated into a city's activities over the longer term.

The steps below outline how a city can implement a LGD. These steps have been put together based on inputs and lessons learnt from cities that are either already implementing LGDs, or aligning their work with the principles of a LGD. More detailed case studies are available for Metropolitan Regions of Amsterdam and Rotterdam-The Hague (The Netherlands), and the cities of Mannheim (Germany), Aalborg (Denmark), Espoo (Finland), Milan (Italy), Leuven (Belgium), Singapore, Nord-Pas de Calais (France) and Umeå (Sweden) in the annex. For additional inspiration, the [European Committee of the Regions' Green Deal Going Local](#) website provides several other examples of initiatives showcasing good practices aligned with those steps.

6.2 The cycle of working with Local Green Deals

The concept of LGDs is deeply rooted in the ability of a city to gain the commitment of local stakeholders to cooperate together. Building trust and relationships across an extensive network will, however, take time. The two cycles of the LGD approach are illustrated in Figure 2 below.

- First cycle: Building momentum:** The first cycle concerns building strong relationships with local individuals and organisations, delivering joint actions and demonstrating that city-stakeholder collaboration adds significant value to implementing initiatives. This first cycle focuses on making the most of immediate opportunities for joint action and building on the existing strengths of the city and local stakeholders. It involves getting existing city staff engaged, identifying quick wins for integrated actions across the city's sustainability framework and mobilising pro-active stakeholders into action. The implementation of successful deals through those initial partnerships will demonstrate that cooperation works and will help build the case to scale up the approach in the following cycles.
- Following cycles: Scaling up:** The goal of the following cycles is to increase the number of partnerships established between the city and local stakeholders, embedding LGDs at the governance level. The steps follow the same logical sequence as the steps highlighted for the first cycle, but some additional actions will be key to scaling up the approach. In particular, a collaborative governance model will need to be formalised to ensure that interactions between different partnerships and initiatives are managed efficiently. Opportunities for new deals should be identified and mobilising efforts should place a stronger focus on local stakeholders that are not traditionally engaged in sustainable thinking. This process is meant to become iterative and long-lasting once effective governance structures are in place. When the first LGDs have demonstrated successes, new deals can be continuously added, covering a wider range of topics and fully embedding collaboration with local stakeholders in the governance framework of the city.

It is worth noting that cities who are considering implementing LGDs may start from different maturity levels. When looking at the approach highlighted above, some cities may realise that they are already doing a lot of the activities covered by the first cycle and already benefit from significant momentum supporting collaboration on sustainable initiatives. Cities benefiting from such a favourable context may want to start directly with stabilising and formalising the approach to streamline processes, scale up and integrate collaborations across their entire strategic and governance frame.

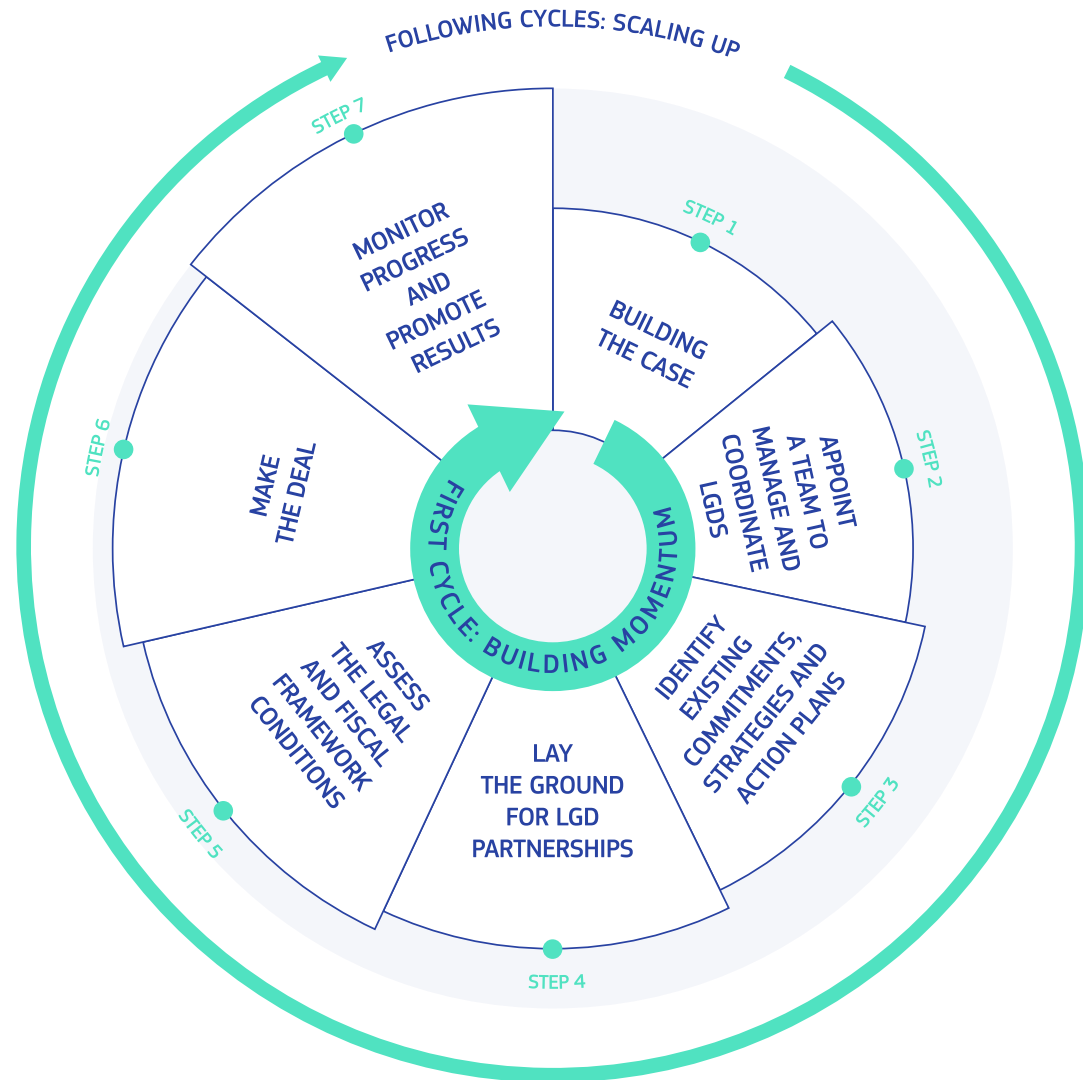

Figure 2: 7 Key steps to develop a Local Green Deal

6.3 Step-by-step approach

STEP 1 – BUILDING THE CASE

1. Identify **existing high-level policy goals**, both at the local and national level. These can help to gather support and potentially form the starting point of a LGD.
2. Assess existing initiatives and practices already led by your city and local stakeholders and **build on what is already being done**.
3. Look at your city's existing governance and implementation structures. How are decisions made? Understanding this picture allows you to identify influencers who can support your LGDs.
4. As a political leader, or a high-level city official, **outline the benefits** the city stands to gain from developing LGDs. Such benefits could include: meeting policy goals; increasing financial efficiency; or improving trust in the local democracy.
5. **Build trust among strategic local stakeholders** and outline how they could benefit from cooperating with the city in developing LGDs.

STEP 2 – APPOINT A TEAM TO MANAGE AND COORDINATE LGDS

1. Setting up LGDs will benefit from being led by a steering group, which has **an inter-departmental mandate** and includes public, private and community representatives.
2. Ensure that your LGD steering group has the right skills. Multi-disciplinary expertise, leadership skills, the ability to build bridges between different stakeholders, a strong understanding of sustainability policy and the ability to engage in networks and discussions at the national and European level would all be essential.¹²

¹² To understand the types of skills and roles needed within the steering group, take a look for an example at the composition of the Amsterdam Economic Board

STEP 3 – IDENTIFY EXISTING COMMITMENTS, STRATEGIES AND ACTION PLANS

1. Identify **existing sustainability policies and targets** (e.g. climate action plan, sustainability strategy, SECAP, climate city contracts etc.), **sectoral policies** (e.g. circular economy roadmap, mobility plan, air quality plan, urban development plan, construction plan, local industrial strategy, social inclusion strategy, etc.) and your **administrative policies** (e.g. procurement strategy, finance policy etc.).
2. Most of your goals, commitments or targets are likely to be relevant for more than one policy area of the EGD and identifying those **interfaces, gaps, potential trade-offs and synergies** between your existing policies is key.

STEP 4 – LAY THE GROUND FOR LGD PARTNERSHIPS

1. Clear **political support** towards the LGDs will help address institutional barriers to change, foster internal buy-in for the initiative and add credibility to the process when communicating with citizens and stakeholders.
2. Implementing LGDs will require widespread **internal buy-in within the city administration**. Identify and engage LGDs champions in all of your departments, notably functional teams, which play a key role in delivering LGDs (e.g. the finance and procurement teams).
3. A **stakeholder mapping** exercise will help you identify local community leaders, business representatives and initiatives that need to be brought on board to support your work. As a starting point, your engagement activities should include discussions with local economic actors (e.g. key local employers), leaders of existing sustainability initiatives (e.g. proximity and social economy enterprises) and key providers of community services (e.g. associations of teachers, or social workers).
4. In order to turn stakeholder engagement into action, you should identify initiatives providing immediate opportunities for cooperation.
5. For every opportunity identified, you should ensure that your staff members leading the dialogue are committed to following up with stakeholders and supporting implementation. Your goal should be to add value to the stakeholders' sustainability initiatives. Building up this trust will be key to allowing you to progressively turn one-off initiatives into formal cooperation agreements/ deals between your city and your stakeholders.
6. Digital tools should be at the centre of your LGDs promotion activities. Creating discussion groups on existing social media platforms can help you start a digital community with limited upfront investment.

STEP 5 – ASSESS THE LEGAL AND FISCAL FRAMEWORK CONDITIONS

1. The European Commission is currently promoting national and European research, policy and legislative initiatives that can support LGDs.
2. Discussions at the national level might be more impactful coming from a **group of cities**. Consider approaching other cities exploring the development of a LGD within your country to enter joint discussions with your national government. If needed, use a third party organisation to help coordinate this dialogue (e.g. a national association of municipalities). The ICC and other initiatives, like the Green Deal Going Local, or LGD-relevant EU funded projects, supported under the SMP, such as ALLIANCE and CLIMAA, can help you identify other cities working on LGDs in your country.
3. The delivery of your LGDs should not rely solely on national funding. Also explore what **other funding sources might be able to support your plan** (e.g. loans, private investment, citizen cooperatives, EU financial instruments, project grants etc.) – see section 5 above.
4. Review the revenue generating capacity of public investments foreseen under your LGDs, to understand their capacity for self-financing and the extent of additional funding which may be required.
5. Participatory governance models can lead to **participatory funding structures**. The more your local stakeholders, businesses and institutions are on board and involved with the delivery of your LGD, the more they are likely to bring in their own financial resources to drive initiatives forward. Therefore, make sure to discuss business models and funding questions directly with local stakeholders whenever you explore initiatives with them. Direct public funding should only be used as a last resort for projects that cannot be supported with private capital.

STEP 6 – MAKE THE DEAL

1. Set up regular meetings to work on cross-cutting issues, specific topics and initiatives that support collaboration and knowledge exchange.
2. Develop **mutual agreements** between a coalition of companies, civil society organisations and local governments. The agreement should **define the initiative or action to be implemented and outline the roles** of the different partners involved.
3. Agree on the **allocation of resources and time plans** for the implementation of the initiative and actions.
4. **Make available information on activities, progress, results** and calls for new initiative. To achieve this, consider developing a single digital platform dedicated to LGD initiatives and actions.

STEP 7 – MONITOR PROGRESS AND PROMOTE RESULTS

1. A LGD should be flexible and responsive to new challenges and opportunities. The LGD steering group (set up under Step 2) should undertake **regular and transparent monitoring** to assess progress against objectives and identify areas where city intervention is needed to address challenges.¹³
2. Communication is crucial. On a local level, **promote your vision, progress and successes**. Share knowledge that is easy to understand in the local community.
3. Throughout the implementation phase, keep **engaging with other cities** that are delivering LGDs to share experiences and good practices. The ICC and ICLEI- Local Governments for Sustainability can organise and facilitate exchange of insights and strategies with other pilot cities and the European Commission.

¹³ LGDs monitoring and communication activities can take inspiration from existing templates. See for example the guidance provided to support the SDG Voluntary Local Reviews, the EU Green Capital reporting/application guidelines and Self-Assessment Tool for Sustainable Urban Development strategies (SAT4SUD) or the Nesta toolkit for sharing public data.

Case Studies

AMSTERDAM METROPOLIS REGIONAL GREEN DEALS

Background

The *Metropolitan Region Amsterdam* (MRA), which encompasses the area around the Dutch capital city of Amsterdam, is a governmental cooperation of 32 municipalities, 2 provinces and 1 transport authority. With its 2.5 million inhabitants, it is the largest urban area in the Netherlands. It is also the country's economic centre, providing 1.5 million jobs and accounting for 20% of the country's GDP. In addition, it is home to some of the country's most strategic infrastructure, including an airport, a seaport and an internet exchange point.

This concentration of economic activity leads to a strong demand for energy and resources within the area, driving social and environmental pressures. Over the past years, the Metropolitan Area has developed an integrated strategy to deliver a lasting solution to those challenges.

The overall ambition – working to become an international top region with a high quality of life by investing in a future-proof and well-balanced metropolis – has been translated into four administrative tasks:

1. Further strengthen the partnership;
2. Pursue a resilient, inclusive and 'green' MRA economy;
3. Build with housing needs in mind and strengthen the quality of life of the entire region through growth;
4. Accelerate the establishment of the metropolitan mobility system.

A goal has been formulated for each of these tasks, which has been developed into various actions and results. The authorities in the MRA address these jointly and report on the results to their members of the Provincial Councils and City Councils.

In 2020, the COVID-19 crisis significantly impacted the region, costing the local economy EUR 2.3 billion per month and putting over 25% of local jobs at risk. The Metropolitan Region approached this socio-economic shock as an opportunity to rebuild the region on more sustainable foundations. Together with the Amsterdam Economic Board – a triple helix organisation working towards the smart, green and healthy future of the region – the region developed a [green deal approach](#). Thus contributing to the energy, circular economy and digital transition. In 2022, additionally the city of Amsterdam's 'Amsterdam Impact' programme joined forces under the [CLIMAA project](#) together with the MKB business network. The aim of the project is to seal 10 LGDs with small and medium-sized enterprises (SMEs), especially social entrepreneurs.

The Metropolitan Region and the Amsterdam Economic Board know this transition cannot be achieved without the buy-in, involvement and commitment of its local stakeholders. In 2020, a new approach was launched to facilitate cooperation between local stakeholders and local government on initiatives supporting its strategic targets. This approach consists of setting-up 'Regional Green Deals' to structure the collaboration between public and private actors. So far, four Regional Green Deals have been established, focusing on 'Circular Textiles', 'Tech talent and sustainable jobs', 'Timber-based construction' and the development of a 'Bicycle Metropolis'. Before the COVID-19 crisis, the Amsterdam Economic Board was already working on the Regional Green Deal Zero-Emission Urban Logistics, connected to the national initiative of the same name.

In general, the Amsterdam Economic Board works to lay the ground and create the right ecosystem for creating cooperation between government, business and knowledge stakeholders.

For specific subjects, a diversity of stakeholders discussed the topics for green deals: where further cooperation and commitments towards 2025 goals would lead to acceleration and impact for the region.

Structure

The goal of each Regional Green Deal is for the parties involved to jointly develop concrete investment propositions or agreements that will create both short-term jobs and long-term economic opportunities aligned with the sustainability targets of the region. Wherever possible, each deal seeks to reflect and integrate more than one of those targets. For example, the Green Deal on sustainable timber construction is working simultaneously towards socio-economic goals (delivering affordable housing in the city region and creating 1,750-3,700 new jobs in a sustainable sector) and environmental goals (reduction of 220,000 tons CO₂/year).

Agreements typically take the form of voluntary arrangements in a cooperation programme between various public and private stakeholders. The agreements clearly state the role, resources and actions that each party will undertake to deliver initiatives. For example, all parties to the 'Tech talent and sustainable jobs' deal have agreed to meet the target of re-skilling 10,000 people in tech and green jobs by 2024. Actions and responsibilities identified to work towards this goal include a commitment from education providers to develop flexible teaching programmes focusing on reskilling, a commitment from companies to invest in green and tech skills development for all their staff and an agreement from businesses and public authorities to collaborate in finding temporary work opportunities in green tech jobs for staff made redundant by the COVID-19 pandemic.

Each deal is designed to be flexible, so that additional actions and initiatives can be integrated over time.

Governance and management

The implementation of the Regional Green Deals is governed by the MRA and the Amsterdam Economic Board. The Amsterdam Economic Board is an institution created to streamline the working relationships between the private sector, knowledge institutes and government organisations to achieve the goals of the metropolitan

region. The Board is chaired by the Mayor of Amsterdam and its members include C-level representatives of businesses and knowledge institutions and politicians from the region. Its diverse membership affords the Green Deals both strong political leverage and support from influential regional stakeholders.

On a day-to-day basis, each of the deals are managed independently, with its own governance structure, action plan, budget and public engagement activities. Staff members working on each deal also regularly exchange on best practice and challenges that they face, as well as on opportunities for collaboration between the different deals. A Green Deal Steering Committee oversees the activities of all the green deal programmes and helps to activate the network and discuss and overcome obstacles when necessary.

Stakeholder involvement

The Regional Green Deal approach is rooted in public-private cooperation. MRA guarantees strong government involvement, while the Amsterdam Economic Board acts as a key facilitator to identify, coordinate and support the involvement of stakeholders into the Regional Green Deals. Their methodology to drive stakeholder involvement is built on 4 steps: recruitment of interested stakeholders, identification of collaboration opportunities, facilitation of exchanges and advisory support through data-driven insights.

Currently, the engagement activities of the Amsterdam Economic Board focus mainly on the business community, government parties, universities and research institutes, following a [Triple Helix](#) model. The Amsterdam Economic Board can, however, count on a strong culture of sustainability activism across the wider civil society. For example, the Board helped initiate the [Amsterdam Doughnut Coalition](#), an initiative that brings together local businesses, social enterprises, NGOs and citizens to deliver sustainable actions within the Municipality of Amsterdam. Amsterdam Smart City, TechConnect and House of Skills are programmes organised under the Amsterdam Economic Board, working on cooperation for a smarter and greener city

by open innovation, tech talent and talent for the green transition. Where possible, those existing actions will be integrated within the Regional Green Deals.

Funding

Core funding for managing the Regional Green Deals mainly comes from the budget of the region and from the Amsterdam Economic Board, which originates both from local government sources and from the membership fees paid by private sector representatives who sit on the board.

Funding for initiatives taking place under each of the deals largely originates from the local stakeholders involved. The region is however exploring additional funding opportunities to support new initiatives and innovative action. Sources considered include EU structural funds, RRF and other national funding.

EU and national links

While the Regional Green Deals do not explicitly refer to the EU Green Deal, the topics covered align strongly with its goals. Consequently, the region and the Amsterdam Economic Board will be exploring opportunities to secure funding opportunities arising from the EU Green Deal to support its approach.

The MRA's Regional Green Deals approach is partly inspired by the Dutch Government's national Green Deals initiative. Between 2011 and 2014, the [National Green Deals](#) brought together 1,090 participants from companies, local stakeholder organisations and local and regional governments to work with the national Government on green growth and social issues covering 176 topic areas. Combined with the triple helix way of working towards a smart, green and healthy future for the region, which has been practised by the Board since 2010, this has provided a good basis for cooperation between local stakeholders of the MRA, local government and national institutions.

Technologies

The idea that the green and digital agendas (or twin transition) are mutually connected is widespread in the region. That is not only visible in the use of platforms for cooperation, such as amsterdamsmartcity.com, but on a deeper level in various activities. The Amsterdam region sees the value in connecting digital data tools to create, for example, circular textile value chains, data for 'materials passports' in the construction sector, connected to the related green deals. And the effect is also seen in the [LEAP programme](#) for the regional data centre value chain: while the amount of data will continue to rise in the coming decades, the programme supports innovation in data energy efficiency and circular digital hardware.

Monitoring

The progress of each Regional Green Deal towards its 2025 targets will be monitored regularly by the Green Deal Steering Committee.

Success factors:

- The urgency of the twin (green and digital) transition is widespread. The Amsterdam Economic Board has been working for over a decade on building relationships between public authorities, the knowledge sector and private stakeholders to promote sustainable growth. This pre-existing network was key in enabling the Board to rapidly identify and gain the commitment of key local stakeholders to each Regional Green Deal;
- The development of the Regional Green Deal approach benefited from the template provided by the Dutch National Green Deals, the momentum of the European Green Deal and the COVID-19 crisis. The ability to use an existing evidence base and gain inspiration from this experience helped the MRA rapidly define an action plan for its Regional Green Deals;

- Driving a Green Deals approach at the regional level is based on strong commitment and cooperation from each municipality within the Metropolitan Region, in collaboration with stakeholders from the knowledge institutes and the business sector.

Key challenges

- Throughout 2021, political instability in the Dutch national government has led to delays in the development of the EU RRF plans. Securing budget to support the Regional Green Deals and create additional deals is challenging;
- The Regional Green Deals are currently restricted to topics where a strong drive from local stakeholders to promote sustainable transformation already exists and defining actions under a Green Deal would help create momentum to reach shared goals. Meanwhile, the Amsterdam Economic Board, together with regional governments, is currently working on over [ten initiatives](#) and [three programmes](#) contributing to the green and digital transitions. These activities are all related to the new Regional Green Deals, either directly (e.g. circular textile, talent programmes) or indirectly (e.g. LEAP or data).
- It is acknowledged that the preparation phase for LGD requires an investment in time and efforts and a neutral intermediary party is often a success factor to establish effective public-private cooperation. MRA has however experienced difficulties in finding funding for this critical stage, which is slowing down implementation of the whole process.

SUSTAINABLE ESPOO

Background

With its 290,000 inhabitants, Espoo is the second largest and fastest growing city in Finland. Espoo is part of the Helsinki Metropolitan area and is home to leading RDI institutions, as well as many of Finland's most well-known high-tech companies, such as Nokia, Kone and Neste. Over the past decades, strong political support for sustainable development has promoted a culture of sustainability and sustainable entrepreneurship across the city, in line with the United Nations' SDGs.

Sustainable development is an integral part of the city's strategy, the Espoo Story. The Espoo Story was written in 2013 in collaboration with the residents of Espoo, city personnel and decision-makers. The Espoo Story seeks to build economically, ecologically, socially and culturally sustainable transformation in the city, guiding the city's operations towards common goals. All sectors and units of the city derive their own stories and goals from the Espoo Story and its common objectives. It is also backed up by four interconnected, cross-administrative development programmes: Sustainable Espoo, Participatory Espoo; Inspiring, dynamic Espoo; and Healthy Espoo. In 2022, the city of Espoo started an exchange and learning programme on LGDs as a partner of the ALLIANCE project. The aim of the project is to exchange with the cities of Mannheim and Umeå plus representatives of their local social economy on developing LGDs. The focus lies primarily on small and medium-sized enterprises (SMEs), but includes civil society actors as well.

Structure

Under the overarching goal of coordinating private and public actions to support the Espoo Story, each of the four development programmes are responsible for developing and implementing 4-year action plans, setting out the actions envisaged to support the Espoo Story across the city.

The objectives for the current term (2021-2025) include:

1. Espoo will be a pioneer in implementing the UN Sustainable Development Goals;
2. Espoo will achieve carbon neutrality by 2030;
3. The Espoo community and residents will act sustainably;
4. Espoo will be a model city of sustainable urban development;
5. Espoo will be the best developer partner for sustainable and smart urban solutions.

The action plan is designed to be flexible, so that new initiatives supporting those objectives can be added to the programme and supported by the Sustainable Espoo team as they arise.

Governance and management

The Sustainable Espoo Programme has a steering group that is composed of senior officials from all city sectors, including the Mayor and elected officials representing different political groups. The steering group is responsible for defining and following the programme action points and spreading them across the organisation for implementation. In addition, a rapidly growing sustainability team has been appointed to carry out innovative projects together with external partners and companies and to coordinate the advancement towards the city's objectives. The team also works closely with other departments, with the aim of ensuring sustainability informs all the city's actions. For example, cooperation with the Participatory Espoo development programme and with members of the Education and Cultural Services helps promote cultural change across the city. Sustainability targets are shared by different sectors in the city. For example, the city's Premises Department, which is responsible for the administration of over 400 city-owned buildings, has achieved carbon neutrality of the electricity supply of these buildings.

Stakeholder involvement

- The Sustainable Espoo team places a strong focus on cooperating with local businesses who are keen on leading sustainability actions. It has developed

working relationships with close to one hundred local businesses. Cooperation methods include providing advice to businesses wanting to align with the city's sustainability goals, joint working on standalone initiatives (e.g. co-developing new circular and low-carbon city solutions at Kera – a former industrial area) and strategic partnerships with companies headquartered in Espoo (e.g. digital technologies partnership with Nokia and developing carbon free district heating with local energy provider, Fortum);

- In order to reach out to citizens, the city focuses on leveraging the influence of public service providers such as teachers and social workers. Those intermediaries act as key champions of Espoo's sustainability goals among local communities.

Funding

- Part of the Sustainable Espoo work is funded directly through the City's budget. This is facilitated by the national regulatory framework which allows the City to levy taxes and by the fact that the local median taxable income of residents is among the highest of all Finnish cities. Sustainable development is seen as a strategic priority and an investment for the future;
- The City is also constantly looking for EU and national funding to support exploratory and innovative projects supporting its sustainability goals. For example, a Nokia-led group of local companies received a EUR 26 million contribution from the Finnish Government's innovation funding to unlock the potential of industrial 5G networks in increasing safety, sustainability and efficiency;
- Public funding is mostly used to kick-start private investment into sustainable initiatives. Public investment focuses on lowering the risks and barriers that businesses face for sustainable innovation. For example, part of the business case for the City's investment in a sustainable metro system was that the project should attract up to ten times more private investment in the city than the project's original costs.

EU and national links

Espoo has committed to global and European sustainability goals by signing the Global Covenant of Mayors in 2016, joining the SDG Cities Leadership Programme in 2017 and subscribing to the European Circular Cities Declaration in 2020.

At a local level, Espoo actively contributes to regional and national sustainability policy, participating in several steering groups, or, for example, taking an active part in the design of Finland's COVID-19 recovery plan.

Espoo's Sustainability team closely follows the development of the European Green Deal policies and took them into account when designing the content of the Sustainable Espoo programme for 2021-2025.

Technologies

- Sustainable Espoo actively supports the development of sustainable technologies. Its approach is rooted in cooperation with local businesses. Technological innovation is supported through channels including direct public procurement and funding (e.g. a pilot on self-driving public transport buses with a local company), regulation, planning and project management support, research projects (e.g. EU Horizon 2020 funded SPARCS project developing energy positive districts), promotional activities (such as expressing public support for companies which pioneer circular business practices) and partnerships (e.g. co-investing and developing a carbon-neutral heat district with a local company);
- Espoo is embedding its sustainability goals within its management software, by, for example, including SDG-related guidelines in its procurement tool. This digitised process will allow for the SDGs to be more systematically considered at different stages of decision-making.

Monitoring

The progress of the Sustainable Espoo programme is regularly reviewed by the Sustainable Espoo steering group, which is composed of both political and operational representatives. The group meets every 3-4 weeks and makes the meeting minutes publicly available on the Espoo website. Mid-term and final reports are submitted to the city council to evaluate and document progress towards agreed targets.

In 2020, Espoo prepared a Voluntary Local Review (VLR) to report on the city's sustainability work under the UN SDGs framework. The report was prepared in cooperation with close to a thousand people, representing the city organisation, citizens and different stakeholders.

Success factors

- Sustainable Espoo builds on decades of strong political commitment for sustainability. This has helped the city develop a strong vision, brand and reputation for sustainability, allowing it to attract and inspire employees, residents, companies and investors who are willing to support its sustainability goals;
- Sustainable Espoo excels in capitalising on the city's rich ecosystem of businesses and research institutes. A culture of delivering added value to local stakeholders investing in sustainability has been key to driving private initiatives that align with the city's goals.

Key challenges

- Sustainability goals are integrated in the city strategy, ensuring that social, cultural, ecological and economic sustainability is mainstreamed in all decision-making, investment and services of the city;

- Promoting widespread commitment from citizens is also a long-term challenge. For example, private car ownership rates remain high, which is a key issue for the city's carbon neutrality goals. Espoo aims to address this through a long-term approach, combining collaboration with local companies, through for example, shared mobility and investment in initiatives that facilitate sustainable lifestyles in the city. For example, investment in public transport and biking infrastructure and services and focusing on urban planning policies based on providing all daily services in five city centres, thus reducing the need to move around.

MANNHEIM LOCAL GREEN DEAL

Background

Mannheim is one of the largest cities in southwest Germany, home to 310,000 inhabitants. The city was once an industrial hub, but has, over the last decades, sought to use ambitious sustainability action to shape its reinvention.

By embedding the UN SDGs throughout its policy framework and by joining international networks that support sustainable urban development, Mannheim has acquired significant experience in the development of sustainability initiatives. The City has, however, come to realise that isolated actions from across its departments will not be sufficient to transform its entire socio-economic model. Consequently, it has used the launch of the EU Green Deal as a strategic opportunity to re-shape its approach to delivering sustainability policy. Its goal is to drive deep structural change by building bridges between sectoral priorities, leveraging action from local stakeholders and exchanging with other cities to develop more effective ways of working.

In October 2020, Mannheim formalised this commitment by authoring and launching the *Mannheim Message*, which sets out its vision for developing a LGD approach. This vision, which was developed in the context of the *European Sustainable Cities and Towns Conference in 2020*, is rooted in a spirit of international collaboration. Other cities wishing to develop a LGD on a similar basis are welcome to endorse the Mannheim Message. In 2022, the city of Mannheim started an exchange and learning programme on LGDs as a partner of the ALLIANCE project. The aim of the project is to exchange with the cities of Espoo and Umeå plus representatives of their local social economy on developing LGDs. The focus lies primarily on small and medium-sized enterprises (SMEs), but includes civil society actors as well.

Structure

The basis for the Mannheim LGD consists of three key aspects: a vision (the Mannheim Message); the existing local, national and European policy framework; as well as an analysis of local stakeholders and their willingness to get involved. The city launched the process to develop its climate action plan as part of its broader LGD with the aim to achieve climate neutrality in summer 2021, and presented it at the [COP26 in Glasgow](#) (United Kingdom) in November 2021. This shows how the broader LGD framework functions as a flexible structure, so that it can integrate new opportunities emerging from city departments or local stakeholders on a rolling basis.

Governance and management

The city's LGD work is supported by both the City Mayor and the Deputy Mayor for Environment and Climate. The City Mayor is frequently seen presenting the Mannheim LGD vision at European events, helping to build visibility and commitment around this work.

In order to manage the initiative on a day-to-day basis, the City has created a new LGD team, which currently aims to employ eight 'LGD agents', covering the eight thematic fields of the European Green Deal, as coordinators and contact points for the LGDs implementation. Based on the initial vision for the initiative (the Mannheim Message), the team's work centres on engaging with their colleagues across the entire administration. The goal is to obtain widespread buy-in for the LGD, so that the upcoming action plan can integrate initiatives emerging from all of the city's departments.

It is anticipated that each initiative set out in the action plan will follow its own internal governance structure, funding and timescales. However, the core LGD team will facilitate knowledge exchange and will create synergies between initiatives.

Stakeholder involvement

Cooperation between the City and local stakeholders is a core principle of the Mannheim LGD. The LGDs team is currently encouraging other City departments to engage with businesses, citizens, social economy actors and local institutions who could help shape initiatives under its upcoming action plan. In particular, the City of Mannheim in Germany has used the ICC's first edition of the Local Green Deals Blueprint for Action to facilitate successful partnerships with businesses, industry organisations and service providers, resulting in their iDEAL Business Climate Action and over 17 partnerships with private companies. In the spirit of collaborative governance, this effort included an expert advisory panel, City District Managers, the Mayors' Department Conference and other city administrators. Mannheim has also addressed the challenge of financing sustainable solutions by engaging banks, local businesses and educational institutions, as well as individual citizens. For example, the GBG – Mannheimer Wohnungsbaugesellschaft mbH, the largest municipal housing association in Baden-Württemberg – committed to the iDEAL Business Climate Action, is working on forward-looking solutions and initiating model projects for sustainable construction and living. The company has committed to refurbish 4000 flats and introduce grey water reuse in buildings, providing substantial benefits for both the water supply subsystem and also by reducing the demand for fresh clean water and energy consumption demand.

Mannheim's vision for stakeholder involvement, however, goes beyond the participation of local citizens or organisations into standalone initiatives. The City believes that in order to facilitate comprehensive cultural change towards sustainable lifestyles, some of the fundamental structures of society need to be reformed. Through its LGD process, the City will therefore be looking at regulatory reforms, which would support a shift towards sustainable lifestyles. Measures considered include the adoption of a guaranteed living income, fiscal incentives to promote sustainable lifestyle choices, reforms to shift the burden of taxation away from labour towards natural resource use and pollution and incentives to promote the use of resources as a service rather than individual ownership.

Funding

The work of the LGDs team is currently largely funded through the City's core budget. National government support has also been secured to fund an additional full-time position to support the team. In order to deliver initiatives under its LGD action plan, the City will pool funding from different sources. This will include redirecting some of its departments' budget towards such initiatives, applying for EU funding to kick-start cooperation and support innovation and helping local stakeholders develop viable business models for sustainable actions, ensuring that those can be privately funded in the long-run. The City has already submitted a proposal for a Horizon 2020 call, which would provide funding to support the co-creation of LGD initiatives between the City and local stakeholders.

EU and national links

The City's LGDs are fully inspired by the EU Green Deal. It will notably identify actions and initiatives covering each of the EU Green Deal policy areas, integrating them wherever possible. Thanks to a new staff member focusing on peer-to-peer learning, the LGD team intends to develop strong connections with other EU and German cities, aiming to exchange knowledge and apply jointly for funding opportunities. In line with the Mannheim Message, the City will also engage with the German national government to discuss regulatory reforms which would support the structural change necessary to achieve a sustainable transition.

Technologies

The adoption of new technologies is identified in the Mannheim Message as a key lever to promote sustainable transformation. The City is notably exploring opportunities to adopt digital solutions to support better planning, decision-making, management and monitoring of its LGD.

Monitoring

The progress of the LGD will be regularly assessed against set targets.

Success factors

- Mannheim has developed strong connections with other cities and international networks specialising in sustainable development. This network provides it with valuable support for its LGD, including peer-to-peer learning, strategic advice and opportunities to apply for joint funding;
- The City can build on a strong culture of sustainable activism within its local communities. Citizens are generally environmentally-aware and the social economy sector is very developed. The City administration has clearly contributed to the development of this culture over the years through supportive actions. In 2021, it co-organised the [EU Social Economy Summit](#), which helped to showcase the work of its own social entrepreneurs.

Key challenges

Most of the City's departments have a strong track record of engaging with local stakeholders on specific sectoral topics. A key challenge, however, for its LGDs is to encourage communication between City departments and local stakeholders who do not traditionally engage with each other, to ensure that potential synergies between different LGD actions are fully exploited.

UMEÅ'S CLIMATE CITY CONTRACT

Background

Home to 130,000 inhabitants, Umeå is the largest city in northern Sweden. The city has set itself ambitious sustainability goals in order to meet the Paris agreement and become climate-neutral as a city by 2030 and as a municipality by 2040.

Over the years, the City has developed a policy framework and local governance in order to help it achieve those goals. It has also explicitly linked those climate objectives to social justice and economic resilience goals, leading to an integrated local sustainability framework. Its strong performance in line with those goals led to Umeå being named the European Capital of Culture in 2014, to them being nominated three times for the European Green Capital award and to them being a European Capital of Innovation runner-up.

Thanks to its strong vision, the City was approached in 2017 by the Swedish Government to join the national strategic innovation programme Viable Cities – a national initiative aiming to accelerate the sustainable transition. In 2019, nine of the country's largest cities joined the Climate neutral cities 2030 project. This inspired Umeå to sign the Swedish Climate City Contract in late 2020. In 2022, the city joined an exchange and learning programme on LGDs as a partner of the ALLIANCE project. The aim of the project is to exchange with the cities of Mannheim and Espoo plus representatives of their local social economy on developing LGDs. The focus lies primarily on small and medium-sized enterprises (SMEs), but includes civil society actors as well.

Structure

The national Climate City Contract is a written agreement between the City and four government agencies. It sets out the targets, roadmap and obligations the city needs to meet in order to reach its climate goals by 2030, as well as the support that the national government commits to giving the city for implementing this vision. The targets and actions set out in the contract relate mostly to areas where central coordination, regulation and funding are valuable to unlock the city's goals: for example, setting-up a long-term sustainable investment framework for the city, or developing digital tools to support the climate and energy transition.

At a local level, the Climate City Contract is supported by the existing local policy framework. A local action plan for implementing the contract is also under preparation. This document will identify key initiatives needed to deliver the city's obligation in partnership with key local stakeholders. This action plan will be flexible and updated every year to reflect new opportunities.

Governance and management

The Swedish National Government sets targets and provides centralised leadership to guide the development of Climate City Contracts in the nine cities that are part of the programme. It does so through the Viable Cities programme, a strategic innovation programme driven by the *Swedish Innovation Agency*, the *Swedish Energy Agency*, the *Swedish Agency for Economic and Regional Growth* and the *Swedish government research council for sustainable development*. Viable Cities provides the participating cities with a centralised governance framework, strategic direction, methodological support and collaboration opportunities to implement their own Climate City Contract. At the city level, the Mayor of Umeå and the Chair of the Municipal Board (as lead signatory) both provide the strategic leadership and political commitment for implementing the Climate City Contract.

The day-to-day management structure for the implementation of the Climate City Contract is highly decentralised: responsibility for implementing actions supporting its targets are spread across all of the city's departments. Staff currently driving initiatives under the Climate City Contract include urban planning, circular economy specialists and procurement specialists and climate change experts.

Stakeholder involvement

The Climate City Contract follows a quadruple helix structure. While the municipality is the main party to the contract made with the national government, its action plan will clearly identify opportunities to engage citizens, businesses and local institutions in the delivery of the contract.

Umeå is working with an established culture of business engagement: the city has strong relationships with over 50 local business networks and it intends to leverage those links to support its Climate City Contract action plan. In the second half of 2021, the city launched a promotional campaign and at the end 2022 it signed a climate neutrality roadmap, as its Local Green Deal agreement, with 37 companies and other organisations.

Funding

Core funding for the Climate City Contract comes largely from the Swedish National Government. Several of the City's departments are also using some of their own budget to develop initiatives supporting the Climate City Contract. Additionally, the Viable Cities team is also building up capacity to support cities like Umeå with support for bidding for EU funding to support innovative action. The City has for example applied for funding under a Horizon 2020 call, which would support the co-creation of LGD initiatives between the City and local stakeholders.

In addition, the City has several public-owned companies that support crucial infrastructure for the city. For example, the energy company, water and waste

company and a housing company. These publicly owned utilities companies are investing heavily into supporting a circular economy transition, thereby supporting the City's goals.

Finally, the City is developing a climate change investment plan. The plan should support its climate goals to 2030, both guiding the City in its investment decisions and supporting the local business community by highlighting business opportunities in sustainable sectors.

EU and national links

The Umeå Climate City Contract is fully in line with the Swedish national Climate City Contract framework. The framework is explicitly aligned with the UN SDGs and the Paris Agreement. Discussions are currently taking place to define a strategy for linking it with the EU Green Deal. The Swedish climate city contracts are also in line with the suggested Climate Cities Contracts proposed by the EU Mission board for Climate Neutral and Smart cities. Umeå is acting proactively to exchange knowledge and best practice for the implementation of its Climate City Contract with other cities. It is notably engaging with cities such as Lille (France) and Leuven (Belgium) to discuss opportunities to replicate the Climate City Contract organisational structure outside of the Swedish context.

Technologies

The City has developed several online platforms to openly share data on its progress towards its Climate City Contract goals. It is now looking to develop digital tools to allow stakeholders to feedback and engage directly with the city administration on this topic.

Monitoring

Reporting on the City's Climate City Contract is coordinated centrally by Viable Cities, on behalf of the Swedish national government. The Contract will be updated annually to reflect any challenges and opportunities identified through the review exercise.

Success factors

- The centralised approach of the Swedish Government in coordinating the delivery of Climate City Contracts is key in supporting effective implementation at the city level. National political leadership, funding, guidance, templates and direct collaboration opportunities allows Umeå to work efficiently. Not having to spend extensive resources on setting-up governance and project management structures means that it can focus its efforts directly on actions supporting its Climate City Contract;
- The City administration's flat hierarchical system has been critical in empowering all staff to take initiatives to support the implementation of its sustainability goals. This has been key in promoting innovation and identifying new collaboration opportunities.

Key challenges

A key issue will be to include a wider range of local stakeholders in the Climate City Contract discussions. Getting people, who have traditionally not reflected or worked with sustainable development, on board remains challenging.

MILAN'S AIR AND CLIMATE PLAN

Background

Milan is a city in northern Italy and the capital of the Lombardy region. Home to approximately 1.4 million inhabitants, Milan is the second-most populous city in Italy and is also the country's industrial and financial heart. The City is actively promoting sustainable urban development over a range of policy areas, including sustainable mobility, energy efficiency, sharing economy and smart cities. In addition, in December 2020, the City council adopted an [Air and Climate Plan](#), which addresses adaptation to climate change, mitigation and air quality improvement.

Structure

The Air and Climate Plan is a strategic, transversal instrument that directs the planning already envisaged by the City Administration towards common objectives, such as the reduction of GHG emissions, the improvement of air quality, adaptation to climate change, social equity and health protection. For this purpose, the plan identifies specific actions, which integrate and consolidate other existing city plans.

The Plan consists of 25 targets and 49 actions across five main objectives:

1. **Slow Milan:** a city that moves in a fluid, flexible and sustainable way;
2. **Positive energy Milan:** better and lower use of energy;
3. **Cool Milan:** a city that cools down and reduces the island heat effect;
4. **Inclusive Milan:** a healthier, safer and fairer city;
5. **Informed citizens:** shared aims.

Specific actions to reach the above mentioned objectives are set for the short-, medium- and long-term (2025-2030-2050).

Governance and management

The Air and Climate Plan is fully supported by the Mayor of Milan. By addressing adaptation to climate change, mitigation and air quality, the Plan requires the coordination of three different city departments, namely: the Resilient Cities Department, the Energy and Climate Area and the Agency for Mobility, Environment and Territory (AMAT). The development and actuation of the Plan is being led by the Director of Environmental Transition.

The City Administration has been actively involved in the field of climate adaptation and mitigation and improvement of air quality and has joined other international initiatives and networks, which support these actions, such as the C40 Cities Network, the Compact of Mayors and the Covenant of Mayors.

Stakeholder involvement

The City of Milan benefits from active collaboration with local stakeholders, notably those owned and controlled by the city, such as utilities and transport companies. In addition, the City is developing new business models for cooperating with the private sector on sustainable initiatives: it is for example using a model that includes co-creation, financial support, public procurement and regulatory incentives to encourage businesses, individuals and landowners to build green roofs across the entire city.

Milan has also set up a new Climate General Assembly, based on the non-elective French model, which gathers together community members from the city. The Assembly is currently reviewing the Climate Action Plan. Furthermore, every department in the City has a participatory budget from the administration to be used to collect ideas and projects from the citizens. Most of these focus on greening the city.¹⁴

¹⁴ <https://clevercities.eu/milan/>

The involvement and participation of citizens is a key strength in the city, ensuring current needs are understood and to better determine the priorities for intervention. A public consultation process for the Air and Climate Plan was launched in January 2021 to enable citizens to propose modifications or further integrations in the Plan.

Funding

The transversal nature of the Plan implies that funding will be made available through other existing planning instruments of the City's Administration, which feed into the Plan's objectives. However, the implementation of the Plan requires additional funding. For instance, a loan of EUR 200 million was received from the EIB for the implementation of the Plan. The City also uses structural funds – Horizon 2020, Horizon Europe and LIFE projects – to boost innovation, amounting to approximately EUR 60 million per year.

Milan is currently considering the adoption of a *Milan Transition Fund*. An innovative financing mechanism to support the spending commitment for the implementation of technical and technological solutions for urban regeneration, aimed at achieving decarbonisation and zero-energy consumption.

Lastly, the City has also launched a civic crowdfunding programme.

Monitoring

Monitoring is a fundamental component of the Plan as it allows the status of implementation of the actions and of the objectives to be defined, as well as eventual corrective measures which need to be put in place. The monitoring programme of the Plan will be elaborated and coordinated by the Climate and Energy Department of the Municipality's Environmental Transition Direction together with the Resilient Cities Department. It will monitor the following: the status of advancement of the Plan; the efficacy of the single measures; the overall efficacy of the measures; the costs and financial resources; a performance indicator against inclusivity and equity.

Success factors

- The integrated nature of the Air and Climate Plan allows for synergistic interventions which can benefit all the addressed themes, avoiding the implementation of actions which may have negative side-effects on the environment;
- The model of sustainable development promoted in the Plan is fully aligned with that proposed to address the economic and social impacts of the COVID-19 crisis in the city's [Adaptation Strategy 2020](#).

Main challenges

- The Air and Climate Plan addresses multidimensional themes which requires a stronger internal coordination and goes beyond the traditional sectoral coordination;
- The themes of the Plan extend beyond the borders of the Municipality, which imply that multilevel governance is needed to interact also with national and regional planning.

Kavalenkava - stock.adobe.com

ADDITIONAL EXAMPLES

HAVE YOU HEARD OF...

... “Green Deal Thursdays”?

Another inspiring example comes from the Region of Var (France) and the municipality of Genoa (Italy), working with their Chambers of Commerce and Industry as partners in the Cross Alp-Mediterranean Green Deal project. The project aims at supporting SMEs to develop a circular economy business model by using the instrument of LGDs.

In order to increase the level of awareness about the European Green Deal and local sustainability strategies to address its goals, the project partners created the ‘Green Deal Thursdays’: a series of workshops organised around key topics such as transportation, energy, waste and territorial commitment. Starting in November 2022, the format takes place every month with the aim to provide solutions and training to companies, raise awareness, but also to communicate with public decision makers in order to better adapt local strategies and initiatives. To date, more than 200 companies have signed up for the Green Deal Thursdays.

To engage stakeholders, a survey on the European Green Deal was carried out. Out of more than 120 Var companies surveyed, 83% had never heard of the European Green Deal while 89% had never heard of the local strategies, yet 75% of respondents wanted to know more. In addition, the survey also highlighted the main obstacles encountered by companies in their green transition.

More info: [Cross Alp-Mediterranean Green Deal in the news](#)

Collaborative local governance: a key step towards LGDs

The municipality of Vari Voula Vouliagmeni (MoVVV) is trying to become the first truly smart, green and sustainable city in Greece, through the implementation of applications that will support citizen-centric services, based on international standards and primarily in the fields of energy efficiency, optimal waste management, smart and green mobility, digital services, smart tourism, green and eco-friendly economies.

According to the municipality's Action Plan, it aims to work with both residents and businesses towards the development of small community-driven projects, in order to create a wider sense of ownership and civic engagement and to lay a strong foundation of common values and behaviour upon which to further develop a green economy. With this, MoVVV shows how smaller municipalities can prepare the grounds for LGDs.

More info: [ICC and LGD reports on the CoVVV-website](#)
